Recurrence Relations and Generating Functions

7.1 Lecture 17: Some Number Sequences

Example 7.1.1 (Example 1)

Consider a configuration of n lines where every two lines have a point in common, but no three do. How many regions in the plane are there? Give a recurrence.

$$a_n = a_{n-1} + n$$

TODO: Give an explanation of why this is true.

Example 7.1.2 (Example 2)

Give a simple recurrence for dearrangements.

$$D_n = (n-1)(D_{n-1} + D_{n-2})$$

TODO: Give an explanation of why this is true. Need to review dearrangements from previous lecture.

Consider the Fibonacci sequence $f_n = f_{n-1} + f_{n-2}$, where $f_0 = 0$ and $f_1 = 1$.

Definition 7.1.1: The adjusted Fibonacci sequence: \hat{F}_n

This is the number of 1,2 lists of size n . In other words, consider the number of ways a valet can park A cars (size 1) and B cars (size 2) in a parking lot of size n .

$$\hat{F}_n = \begin{cases} 1 & \text{if } n = 0 \\ f_{n+1} & \text{otherwise} \end{cases}$$

Question 1

Prove

$$\sum_{i=0}^n f_i = f_{n+2} - 1$$

Solution:

Proof. We will prove this by induction on n .

Base case: $n = 0$.

$$\sum_{i=0}^0 f_i = f_0 = 0$$

Similarly,

$$f_{0+2} - 1 = f_2 - 1 = 1 - 1 = 0$$

So, the base case is true.

Inductive Hypothesis: Assume that the following statement is true for $n = k$.

$$\sum_{i=0}^k f_i = f_{k+2} - 1$$

Inductive Step: We will prove that the following statement is true for $n = k + 1$.

$$\sum_{i=0}^{k+1} f_i = f_{k+1} + \sum_{i=0}^k f_i = f_{k+1} + f_{k+2} - 1 = f_{k+3} - 1$$

Therefore, the statement is true for all n by induction. ■

Question 2

Prove

$$1 + \sum_{i=0}^n \hat{f}_i = \hat{f}_{n+2}$$

Solution:

Proof. We will prove this by induction on n .

Base case: $n = 0$.

$$1 + \sum_{i=0}^0 \hat{f}_i = 1 + \hat{f}_0 = 1 + 1 = 2$$

Similarly,

$$\hat{f}_{0+2} = \hat{f}_2 = f_{2+1} = f_3 = 2$$

So, the base case is true.

Inductive Hypothesis: Assume that the following statement is true for $n = k$.

$$1 + \sum_{i=0}^k \hat{f}_i = \hat{f}_{k+2}$$

Inductive Step: We will prove that the following statement is true for $n = k + 1$.

$$\begin{aligned}
 1 + \sum_{i=0}^{k+1} \hat{f}_i &= 1 + \hat{f}_{k+1} + \sum_{i=0}^k \hat{f}_i \\
 &= \hat{f}_{k+1} + \hat{f}_{k+2} \\
 &= f_{k+2} + f_{k+3} \\
 &= f_{k+4} \\
 &= \hat{f}_{k+3}
 \end{aligned}$$

Therefore, the statement is true for all n by induction. ■

Question 3

Prove that f_n is even if and only if n is divisible by 3.

Solution:

Proof. Given that $f_0 = 0$, $f_1 = 1$, and $f_2 = 1$, we can see that at $n = 3$, $f_3 = 2$, which is even.

This is because the only way to get an even number is to have the parity of the two numbers added together (odd + odd or even + even) be the same. So, f_4 must be odd, f_5 must be odd and f_6 must be even.

Given the starting sequence of even, odd, odd. The following sequence must always be even, odd, odd, which repeats every 3 numbers.

Since the first $n = 0$ is the first number in the sequence, every n that is divisible by 3 is even. ■

Note:-

Example problems for later

Guess and prove by induction (you may replace the Fibonacci number by the adjusted Fibonacci number if it helps you)

- $f_1 + f_3 + \cdots + f_{2n-1} = ?$
- $f_0 + f_2 + \cdots + f_{2n} = ?$
- $f_0 - f_1 + f_2 - \cdots + (-1)^n f_n = ?$
- $(f_0)^2 + (f_1)^2 + \cdots + (f_n)^2 = ?$

Obtaining an explicit formula for f_n for linear recurrences

Example 7.1.3

Consider the Fibonacci sequence $f_n = f_{n-1} + f_{n-2}$, where $f_0 = 0$ and $f_1 = 1$. This can be rewritten as a linear recurrence as follows:

$$f_n - f_{n-1} - f_{n-2} = 0$$

We must solve the corresponding characteristic equation. Notice how the largest degree lines up with the "largest" case of the recurrence.

$$x^2 - x - 1 = 0$$

Let q_1 and q_2 be the roots of the characteristic equation.

It is potentially relevant to note that the following is a solution space of the Fibonacci recurrence (but don't satisfy f_0 – the initial condition):

$$\begin{cases} q_1^n - q_1^{n-1} - q_1^{n-2} = 0 \\ q_2^n - q_2^{n-1} - q_2^{n-2} = 0 \end{cases}$$

The rest of this is based on an ansatz, i.e. we need to make an assumption at the answer and validate it later

$$f_n = c_1 q_1^n + c_2 q_2^n,$$

for some $c_1, c_2 \in \mathbb{R}$.

Using the initial conditions of $f_0 = 0$ and $f_1 = 1$, we can solve for c_1 and c_2 .

7.2 Lecture 18: Introduction to ordinary generating series

Note:-

Up until now, we have solved an instance combinatorial problem at a time. However, in some cases, solving a single combinatorial is too difficult. So, we solve all of the combinatorial problems at once.

Consider a sequence

$$h_0, h_1, h_2, \dots, h_t, \dots$$

of natural numbers where h_t is the answer to some counting problem that depends on t .

We can create a generating series of the form:

$$g(x) = h_0 + h_1x + h_2x^2 + \dots + h_tx^t + \dots$$

where $h_t = [x^t]g(x)$.

Note:-

The notation $[x^t]g(x)$ is the coefficient of x^t in the polynomial $g(x)$.

Claim 7.2.1 Compositions Generating Series

$$g(x) = \left(\frac{1}{1-x} \right)^k$$

Example 7.2.1

Fix k . Let

h_t = number of nonnegative integral solutions to

$$e_1 + \dots + e_k = t, e_i \in \mathbb{Z}_{\geq 0}$$

We already know from stars and bars that

$$h_t = \binom{t+k-1}{k-1}$$

So obviously, the generating series can be written as

$$g(x) = \sum_{t=0}^{\infty} \binom{t+k-1}{k-1} x^t$$

Note:-

This doesn't really tell us anything. We just combined some definitions and have a generating series that is hard to utilize in any useful way.

Take our claim and expand it out with Taylor Series k times:

$$\begin{aligned} g(x) &= \left(\frac{1}{1-x} \right)^k \\ &= (1+x+x^2+\cdots)(1+x+x^2+\cdots)(1+x+x^2+\cdots)\cdots \end{aligned}$$

We can see that the coefficient of x^t is the number of ways to write t as a sum of k nonnegative integers. So,

$$h_t = \binom{t+k-1}{k-1}$$

This combinatorially proves the negative binomial theorem:

$$g(x) = \left(\frac{1}{1-x} \right)^k$$

Remark

If you knew that the negative binomial theorem was true, you could use it to algebraically solve the composition problem after choosing the correct generating series $g(x) = \left(\frac{1}{1-x} \right)^k$.

Question 4

What is

$$(1+x+x^2+x^3+x^4+x^5)(x+x^2)(1+x+x^2+x^3+x^4)$$

the generating series for?

Solution: The solutions to the equation

$$e_1 + e_2 + e_3 = t$$

where $0 \leq e_1 \leq 5, 1 \leq e_2 \leq 2, 0 \leq e_3 \leq 4$.

Question 5

Suppose you have 1,5 and 25 cents coins available (infinite supply). Write down the generating series for the number of ways to make change for a dollar. How many ways are there?

Solution:

The generating series for the number of ways to make change for an arbitrary amount of money is:

$$g(x) = (1+x+x^{1+1}+x^{1+1+1}+\cdots)(1+x^5+x^{5+5}+x^{5+5+5}+\cdots)(1+x^{25}+x^{25+25}+x^{25+25+25}+\cdots)$$

This can be simplified as follows:

$$g(x) = \left(\frac{1}{1-x}\right)\left(\frac{1}{1-x^5}\right)\left(\frac{1}{1-x^{25}}\right)$$

$$= \frac{1}{(1-x)(1-x^5)(1-x^{25})}$$

The answers is $[x^{100}]g(x)$.

Question 6: Nonstandard Dice

Compute the generating series for the result of rolling two standard dice.
Now factor it, and interpret.

Solution:

$$g(x) = (x + x^2 + x^3 + x^4 + x^5 + x^6)(x + x^2 + x^3 + x^4 + x^5 + x^6)$$

$$= (x + x^2 + x^3 + x^4 + x^5 + x^6)^2$$

$$= (1+x)(1+x)(x + x^3 + x^5)$$

TODO: How does this factor like this?

After factoring, we can see that this is the equivalent of flipping a coin twice and rolling two 1-3-5 dice.

Question 7

Determine the generating series for partitions.

Solution:

$$g(x) = (1 + x^1 + x^{1+1} + x^{1+1+1} + \dots)(1 + x^2 + x^{2+2} + x^{2+2+2} + \dots)(1 + x^3 + x^{3+3} + x^{3+3+3} + \dots) \dots$$

$$= \left(\frac{1}{1-x}\right)\left(\frac{1}{1-x^2}\right)\left(\frac{1}{1-x^3}\right) \dots$$

$$= \prod_{i=1}^{\infty} \left(\frac{1}{1-x^i}\right)$$

In words, this generating series is the product of compositions of just 1's, 2's, 3's, etc.

Definition 7.2.1: Ordinary Generating Series

Let a combinatorial problem be defined as (S, ω) with S a set and $\omega : S \mapsto \mathbb{Z}_{\geq 0}$. The ordinary generating series is

$$g(x) = g_{(S, \omega)}(x) = \sum_{s \in S} x^{\omega(s)}$$

Theorem 7.2.1 Addition Rule of Generating Series

Suppose $S = A \cup B$ (disjoint union), where (A, ω_A) and (B, ω_B) are combinatorial problems. Moreover $\omega|_A = \omega_A$ and $\omega|_B = \omega_B$.

Then the ordinary generating series for (S, ω) is

$$\begin{aligned}
g_{(S,\omega)}(x) &= g_{(A,\omega_A)}(x) + g_{(B,\omega_B)}(x) \\
&= \sum_{s \in A} x^{\omega_A(s)} + \sum_{s \in B} x^{\omega_B(s)} \\
&= \sum_{s \in S} x^{\omega(s)}
\end{aligned}$$

Note:-

The notation $\omega|_A$ means the restriction of ω to A . In this case,

$$\omega|_A = \{\omega_A(s) \mid s \in A\}$$

Theorem 7.2.2 Product rule of Generating Series

Suppose $S = A \times B$ (cartesian product), where (A, ω_A) and (B, ω_B) are combinatorial problems and

$$\omega(a, b) = \omega_A(a) + \omega_B(b)$$

Then,

$$\begin{aligned}
g_{(S,\omega)}(x) &= g_{(A,\omega_A)}(x) g_{(B,\omega_B)}(x) \\
&= \sum_{a \in A} x^{\omega_A(a)} \sum_{b \in B} x^{\omega_B(b)} \\
&= \sum_{a \in A} \sum_{b \in B} x^{\omega(a,b)}
\end{aligned}$$

What does it mean for two generating series to be equal?

They are equal coefficient by coefficient.

Let $g(x)$ be the generating series for the number of partitions. What does it mean that $g(x)$ equals the infinite product:

$$g(x) = \frac{1}{1-x} \cdot \frac{1}{1-x^2} \cdot \frac{1}{1-x^3} \cdots$$

It means that if we expand/solve enough terms of the RHS, the coefficient of x^t will stabilize (as in no more terms multiplied in will impact the coefficient) and this coefficient will be the same as the coefficient of x^t in the LHS – $g(x)$.

Convergence Issues

Typically, with generating series, we only care about the coefficients and not plugging in any specific value into x . Because of this, we do not need to worry about convergence. However, in some cases $g(x)$ is a polynomial and in these cases, substitution is fine to perform.

Question 8: Substituting into a generating series

Let $S = \{\text{coins in your pocket}\}$ and $\omega : S \mapsto \mathbb{Z}_{\geq 0}$ be the obvious weight function on coins, i.e. $\omega(\text{nickel}) = 5$. Is $g(x)$ the corresponding generating series, what is $g(1)$? What is $g'(1)$?

Solution: $g(1)$ will be the number of coins in your pocket. This is trivially true because each term is x to the power of an integer (with no coefficient), so 1 raised to anything will be 1 and so it is just the number of terms. More mathematically,

$$\begin{aligned} g(1) &= \sum_{s \in S} 1^{\omega(s)} \\ &= \sum_{s \in S} 1 \\ &= |S| \end{aligned}$$

$g'(1)$ will be the amount of money you have. Based on the previous statement, we can see that the derivative of $g(x)$ is just the sum of the powers which represented the values of the coins in your pocket. More mathematically,

$$g'(1) = \sum_{s \in S} \omega(s)$$
